DETAILED ACTION

Priority

1. Receipt is acknowledged of papers submitted under 35 U.S.C. 119(a)-(d), which papers have been placed of record in the file.

Specification

2. The abstract of the disclosure is objected to because it is not on separate sheet of paper, the "Elected for publication: Fig. 6" on line 35 should be deleted. Correction is required. See MPEP § 608.01(b).

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

4. Claims 1-25 and 29-41 are rejected under 35 U.S.C. 102(e) as being anticipated by Pettersson et al, US Pub. 2003/0085884.

Pettersson et al disclose a position code comprising: inputting signal to a decoding device consists of an image or some other digital representation of a detected subset of the position code, which subset codes coordinates for at least one point, the position code is represented graphically by dots that are displaced in a predetermined way in relation to raster points in a raster, as has been described above, the decoding device

Art Unit: 2876

identifies the dots in the image by the use of thresholding, and fits a raster to the dots; the sequences of the main number sequence which are used for positioning and the places of which are unambiguously determined in the main number sequence; the four possible types of rotation of the x- and y-matrices (0, 90, 180 and 270 degrees) are investigated and the current rotation is determined. The structure of Pettersson et al is capable of performing the method steps of the claims. For instance in claim 1, Pettersson et al disclose: retrieving a digital representation of the coding pattern (see par. 0182); identifying said rotations in said digital representation to derive first shift information which designates a phase difference between each rotation and the first cyclic number sequence; generating a first data structure in which each of said rotations is represented by said first shift information and first definition data which represents said first cyclic number sequence; transferring the first data structure to a printer; and bringing the printer to convert the first data structure into a printable image. (see par. 0200+).

Remarks

5. Examiner's note: Examiner has cited particular columns and line numbers in the references as applied to the claims above for the convenience of the applicant.
